

Me in a nutshell.

Ciao!

I'm a data enthusiast and "data obsessed" who has managed more than 50 of data projects in the last 26 years across dozens of industries and characteristics, with **extreme** focus on data **details** and **quality**, finalizing dozens of tech **migrations** and increasing value, recognized as a **steward** by the internal / external customers and helping them to make the right decisions with confidence.

Even today in the conversational and agentic **AI age**, what I've always done throughout my career is becoming essential and a milestone more than ever: having **high-quality data**, automatically prepared, cleaned, governed, **documented**, connected and described with semantic models, protected by **alerts** to detect bugs that can invalidate models, analysis, lead to disruptions and loss of **credibility**.

Main responsibilities:

- During 15 years of work for Italian Credit Bureau, I developed many enterprise DWH projects with highest levels of stakeholders: banks, media and **rating agencies**. The team has achieved increasingly sales volumes and targets every year, increasing complexity and heterogeneity, gaining visibility and recognition both individually and as a team.
- In the last 7 years I coordinated a data management-engineering team, releasing quality & scoring solutions, dozens of data models with all **analytics platforms** data running on all cloud platforms, helping customers grow from just few analyses to hundreds of business cases.
- I managed more than **30 customers** on multiple industries, platforms, project types.

Among various written **recognitions** of my team achievements, I can highlight a congratulatory email from Head of Omni Data Strategy & CRO of our major customer, a congratulatory email from a worldwide customer this year, a survey from a multinational customer with the highest rating achieved of all teams; finally I can proudly mention a call from the American CEO of a global tool who asked for a live meet and mutual collaborations to include a prototype data solution I created from scratch.

My goal is being a **tech leader**, an analytics engineer, a senior analyst, always improving and staying up to date on the latest evolutions in order to deliver reliable, robust and rigorously cleaned solutions that build **trust** with internal / external customers and drive steady growth over time!

In general, I can be described as extremely serious, reliable, accurate, and with a cheerful and socializing spirit.

Alessandro Bertoncelli
